PRECAUTIONS

When working with FIPG material, you must observe the following.

- Using a razor blade and gasket scraper, remove all the old packing (FIPG) material from the gasket surfaces.
- Thoroughly clean all components to remove all the loose material.
- Clean both sealing surfaces with a non-residue solvent.
- Apply the seal packing in approx. 1 mm (0.04 in.) bead along the sealing surface.
- Parts must be assembled within 10 minutes of application. Otherwise, the packing (FIPG) material must be removed and reapplied.

(E150F TRANSAXLE/4WD)
DESCRIPTION

GENERAL
- The E1 50F transaxle has been compactly designed by arranging the transmission, the center differential, the front differential and the transfer on the same quadruple case axle.
- The center differential, which compensates the difference in rotation speed between the front and rear wheels, utilizes bevel gear to provide durability and reliability by distributing the engine power from the transmission 50/50 to both front and rear propeller shafts. This center differential has been equipped with a control coupling which functions as a LSD.
The oil used in each transaxle is as follows:
Transaxle oil E50 (08885–80206) or gear oil super (08885–02106) or equivalent
Recommended oil
Viscosity: SAE 75W–90 or 80W–90
Above – 18°C (0°F) SAE 90
Below – 18°C (0°F) SAE 80W

The oil capacity: 5.2 liters (5.5 US qts, 4.6 Imp.qts)

OIL PUMP
- The oil pump is of the trochoid type, and is driven by the differential ring gear and the pump drive gear. It is located at the bottom of the transaxle case.

POWER TRANSMISSION
- Power from the transmission is transmitted along the route shown below:
SELECT LEVER FOR SERVICING

- Ordinarily, there is no need for the ordinary customer to operate anything.
- However, to operate 2 wheels out of the four, the following switches have been installed.

VISCOUS MODE
This is the mode for use during normal driving. After finishing inspection, be sure to return the lever to this mode and attach the lock bolt.

VISCOUS FREE MODE
This mode cuts off the driving force transmitted from the center differential to the control coupling, and makes the center differential free.

NOTICE: Never use this during normal driving.

FF MODE
This mode cuts off the driving force transmitted from the center differential to the transfer, and locks the center differential.
However, when the lever is shifted to this mode, the driving force is transmitted only to the front wheels.

NOTICE: Never use this during normal driving. It will have a bad effect on the transaxle.
PRECAUTIONS

When working with FIPG material, you must be observe the following.

- Using a razor blade and gasket scraper, remove all the old packing (FIPG) material from the gasket surface.
- Thoroughly clean all components to remove all the loose material.
- Clean both sealing surfaces with a non–residue solvent.
- Apply the seal packing in approx. 1 mm (0.04 in.) bead along the sealing surface.
- Parts must be assembled within 10 minutes of application. Otherwise, the packing (FIPG) material must be removed and reapplied.
